

MongoDB Programming - Java

Add following Maven dependencies in your pom.xml file:

```
<dependencies>
  <dependency>
    <groupId>org.mongodb</groupId>
    <artifactId>mongodb-driver-sync</artifactId>
    <version>4.2.2</version>
  </dependency>
</dependencies>
```

Make Java 9 as your JRE system library (may do as following):

- Right click on the JRE System Library[JavaSE-1.5]
- Click on properties and set the JavaSE to [JavaSE-9]

- Click on Apply and Close.

Add given PostsMain.java file to your project.

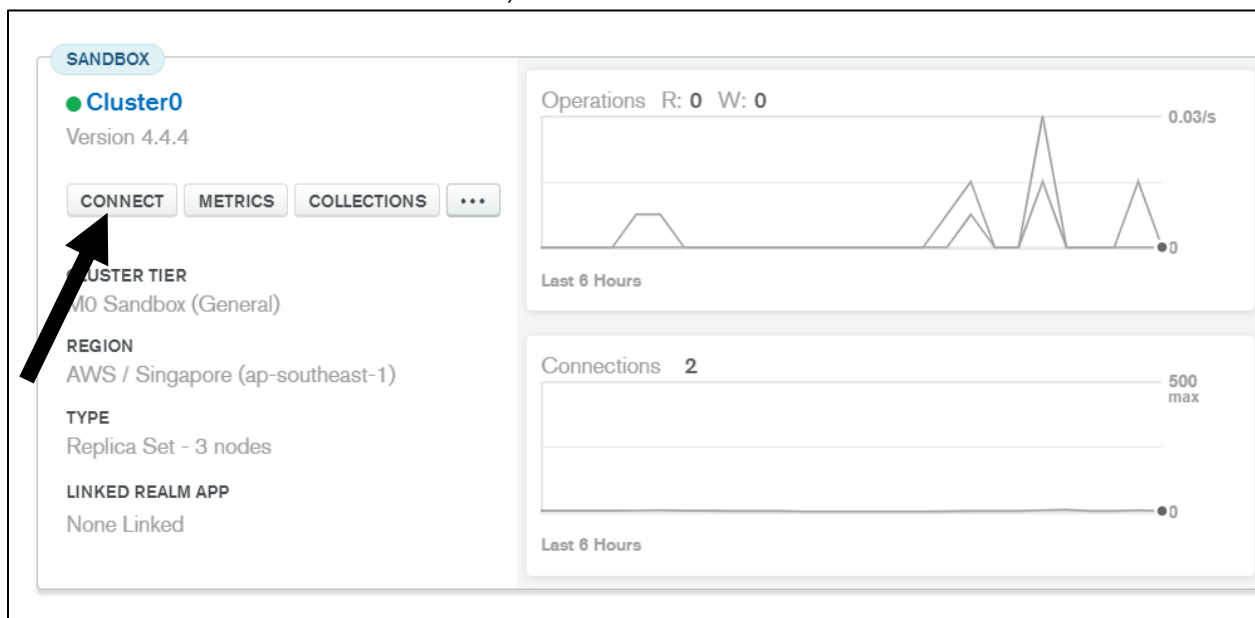

Add atlas server address in your PostsMain.java at the point of creating a mongo client object as following:

```
MongoClient mongoClient = MongoClient.create("<your-mongodb-atlas-string>");
```

Update the part <your-mongodb-atlas-string> with your own link.

For getting the connection string, do the following :

- Under the clusters section, click on Connect

- Click on Connect To Application
- Copy the string mentioned, and enter your own password in place of <password>
